# Knapsack problem

- Knapsack problem:
  - Given  $n$  items of known weights  $w_1, \dots, w_n$ , and
  - Having values  $v_1, \dots, v_n$  and a capacity  $W$
  - Find the most valuable subset of items that fit into the knapsack.
    - Items are to be considered in full, not partially
  - Note: All the weights  $w_i$ 's and knapsack capacity  $W$  are integers, but values can be real numbers.
- Goal: solve the knapsack problem using dynamic programming.

# DP Approach: Knapsack

- To solve knapsack problem using DP,
  - Need to design a recurrence relation
    - Express a solution to an instance in terms of smaller instances.
- Consider an instance defined by first  $i$  items with
  - Weights  $w_1, w_2, \dots, w_i; 1 \leq i \leq n$
  - Values  $v_1, v_2, \dots, v_i; 1 \leq i \leq n$
  - Knapsack capacity  $j, 1 \leq j \leq w$
- Let  $V[i, j]$  be the optimal solution to this instance
  - i.e. the value of most valuable subsets of first  $i$  items that fit knapsack of capacity  $j$ .
- Approach: divide first  $i$  items into two categories:
  - Those that include  $i^{\text{th}}$  item, and
  - Those that don't include  $i^{\text{th}}$  item

# DP Approach: Knapsack

	0		$j - w_i$		$j$		$W$
0	0	0	0	0	0	0	0
	0						
$i-1$	0		$V[i-1, j-w_i]$		$V[i-1, j]$		
$i$	0				$V[i, j]$		
	0						
$n$	0						

Table for solving knapsack problem using dynamic programming

- Category 1: subsets that do not include  $i^{\text{th}}$  item.
  - Value of optimal subset is  $V[i-1, j]$
- Category 2: subsets that do include  $i^{\text{th}}$  item.
  - Thus  $j > w_i$  i.e.  $j - w_i \geq 0$ .
  - Value of optimal subset is  $v_i + V[i-1, j - w_i]$

# DP Approach: Knapsack

- Possible cases:
  - $j < w_i$  (i.e.  $j - w_i < 0$ ), i.e. weight of  $i^{\text{th}}$  item is more than  $j$  and thus can't be included
  - $j \geq w_i$  (i.e.  $j - w_i \geq 0$ ) weight of  $i^{\text{th}}$  item is less than or equal to  $j$ , and thus  $i^{\text{th}}$  item may included or excluded.

- Thus,

$$V[i, j] = \begin{cases} \max\{V[i-1, j], v_i + V[i-1, j - w_i]\} & \text{if } j - w_i \geq 0 \\ V[i-1, j] & \text{if } j - w_i < 0 \end{cases} \quad (1)$$

- The initial conditions can be defined as

$$V[i, 0] = 0 \text{ for } i \geq 0$$

i.e.  $i$  items and 0 capacity

$$V[0, j] = 0 \text{ for } j \geq 0$$

i.e. 0 items and  $j$  capacity

# Example: Knapsack

$$V[i, j] = \begin{cases} \max\{V[i-1, j], v_i + V[i-1, j-w_i]\} & \text{if } j - w_i \geq 0 \\ V[i-1, j] & \text{if } j - w_i < 0 \end{cases} \quad (1)$$

- **Example: consider knapsack of size 5**
  - (i.e. max weight it can hold is 5),
  - **Weights as**  
 $w_1=2, w_2=1, w_3=3, w_4=2$
  - **Values as**  
 $v_1=\$12, v_2=\$10, v_3=\$20, v_4=\$15$
  - **Need to compute  $V[4, 5]$** 
    - Max value with 4 items with knapsack capacity 5

# Example Knapsack

Capacity→ wts, values↓		0	1	2	3	4	5

# Example Knapsack: Optimal Subset

Capacity → wts, values ↓		0	1	2	3	4	5
	0	0	0	0	0	0	0
<b>w<sub>1</sub>=2</b> v <sub>1</sub> =12	1	0	0	12	12	12	12
<b>w<sub>2</sub>=1</b> v <sub>2</sub> =10	2	0	10	12	22	22	22
<b>w<sub>3</sub>=3</b> v <sub>3</sub> =20	3	0	10	12	22	30	32
<b>w<sub>4</sub>=2</b> v <sub>4</sub> =15	4	0	10	15	25	30	37

- Optimal subset
  - Backtrack from maximal value  $V[4, 5]$  to prev. rows.
  - Thus, optimal subsets are
    - $V[4, 5] = 37$  ( $\neq V[3, 5]$ ) implies  $w_4 = 2$  is included
    - $V[3, 3] = 22$  ( $= V[2, 3]$ ) implies  $w_3 = 3$  is not included
    - $V[2, 3] = 22$  ( $\neq V[1, 3]$ ) implies  $w_2 = 1$  is included
    - $V[1, 2] = 12$  ( $\neq V[0, 2]$ ) implies  $w_1 = 2$  is included

# Algorithm: Knapsack using DP

```
Algo DPKnapsack( $w[1..n]$ ,  $v[1..n]$ ,  $W$ )
    int  $V[0..n, 0..W]$ ,  $P[1..n, 1..W]$ ;
    for  $j=0$  to  $W$  do
         $V[0, j] = 0$ 
    for  $i=0$  to  $n$  do
         $V[i, 0] = 0$ 
    for  $i=1$  to  $n$  do
        for  $j=1$  to  $W$  do
            if  $w[i] \leq j$  and  $(v[i] + V[i-1, j-w[i]]) > V[i-1, j]$  then
                 $V[i, j] = v[i] + V[i-1, j-w[i]]$ ;
            else
                 $V[i, j] = V[i-1, j]$ 
    return  $V[n, W]$  (and the optimal subset by backtracing)
```

# Efficiency of Knapsack

- Time Efficiency:  $\Theta(nW)$
- Space efficiency:  $\Theta(nW)$

# Summary

- Knapsack algorithm using dynamic programming
- Efficiency
- Optimal subsets using backtracking
